LED Diagnostics

The green LED to the right of the dipswitches provides alerts to status and error conditions that have occurred. The number of times the LED blinks identifies the error. If multiple errors have occurred, the LED will identify each error in the order in which it occurred. When this is the case, the LED will stay ON for 3 seconds between each error sequence. For example, if a Photo-Eye Error occurred followed by a Roller Thermal Fault, the LED would blink as follows:

1 Blink – ON (3 secs) – 4 Blinks – ON (3 secs) - Repeat

# of Blinks	Status
Steady ON	Normal Operation
1	Photo-Eye Error
2	Jam Time Error
3	Control Card Thermal Fault
4	Roller Thermal Fault
5	Roller Lock/Over-Current Fault
6	Power/Low-Voltage Error
7	Slave Card Error (Master Mode)
